#### CSCI 599: Digital Geometry Processing

# 9.2 Surface Deformation II

Hao Li

http://cs599.hao-li.com

#### **Last Time**

#### **Linear Surface Deformation Techniques**

- Shell-Based Deformation
- Multiresolution Deformation
- Differential Coordinates

#### **Nonlinear Surface Deformation**

- Nonlinear Optimization
- Shell-Based Deformation
- (Differential Coordinates)

# **Nonlinear Optimization**

Given a nonlinear deformation energy

$$E(\mathbf{d}) = E(\mathbf{d}_1, \dots, \mathbf{d}_n)$$

find the displacement  $\mathbf{d}(\mathbf{x})$  that minimizes  $E(\mathbf{d})$ , while satisfying the modeling constraints.

• Typically  $E(\mathbf{d})$  stays the same, but the modeling constraints change each frame.

#### **Gradient Descent**

- Start with initial guess d<sub>0</sub>
- Iterate until convergence
  - Find descent direction  $\mathbf{h} = -\nabla E(\mathbf{d})$
  - Find step size  $\lambda$
  - Update  $\mathbf{d} = \mathbf{d} + \lambda \mathbf{h}$
- Properties
  - + Easy to implement, guaranteed convergence
  - Slow convergence

#### **Newton's Method**

- Start with initial guess d<sub>0</sub>
- Iterate until convergence
  - Find descent direction as  $\mathbf{H}(\mathbf{d}) \mathbf{h} = -\nabla E(\mathbf{d})$
  - Find step size  $\lambda$
  - Update  $\mathbf{d} = \mathbf{d} + \lambda \mathbf{h}$
- Properties
  - + Fast convergence if close to minimum
  - Needs pos. def. H, needs 2<sup>nd</sup> derivatives for H

### Nonlinear Least Squares

Given a nonlinear vector-valued error function

$$\mathbf{e}(\mathbf{d}_1, \dots, \mathbf{d}_n) = \begin{pmatrix} e_1(\mathbf{d}_1, \dots, \mathbf{d}_n) \\ \vdots \\ e_m(\mathbf{d}_1, \dots, \mathbf{d}_n) \end{pmatrix}$$

find the displacement d(x) that minimizes the nonlinear least squares error

$$E(\mathbf{d}_1,\ldots,\mathbf{d}_n) = \frac{1}{2} \|\mathbf{e}(\mathbf{d}_1,\ldots,\mathbf{d}_n)\|^2$$

### **Ist order Tayler Approximation**

$$E(\mathbf{d}_1,\ldots,\mathbf{d}_n) = \frac{1}{2} \|\mathbf{e}(\mathbf{d}_1,\ldots,\mathbf{d}_n)\|^2$$

$$\|\mathbf{e}(\mathbf{d}^{k+1})\|^2 \approx \|\mathbf{e}(\mathbf{d}^k) + J_{\mathbf{e}}(\mathbf{d}^{k+1} - \mathbf{d}^k)\|^2$$

$$\|\mathbf{e}(\mathbf{d}^{k+1})\|^2 \approx \|\mathbf{e}(\mathbf{d}^k) + J_{\mathbf{e}}\Delta\mathbf{d}^k\|^2$$

**Taylor Approx** 

$$\Delta \mathbf{d}_{\min}^k = \arg\min_{\Delta \mathbf{d}^k} \|\mathbf{e}\|^2$$

$$\mathbf{h} = \arg\min_{\Delta \mathbf{d}^k} \|\mathbf{e}\|^2$$

$$J_{\mathbf{e}}^{\top} J_{\mathbf{e}} \mathbf{h} = -J_{\mathbf{e}}^{\top} \mathbf{e} (\mathbf{d}^k)$$

Gauss-Newton

#### **Gauss-Newton Method**

- Start with initial guess d<sub>0</sub>
- Iterate until convergence
  - Find descent direction as  $(\mathbf{J}(\mathbf{d})^{\mathrm{T}}\mathbf{J}(\mathbf{d}))\mathbf{h} = -\mathbf{J}(\mathbf{d})^{\mathrm{T}}\mathbf{e}$
  - Find step size  $\lambda$
  - Update  $\mathbf{d} = \mathbf{d} + \lambda \mathbf{h}$
- Properties
  - + Fast convergence if close to minimum
  - + Needs full-rank J(d), needs 1<sup>st</sup> derivatives for J(d)

# **Nonlinear Optimization**

- Has to solve a linear system each frame
  - Matrix changes in each iteration!
  - Factorize matrix each time
- Numerically more complex
  - No guaranteed convergence
  - Might need several iterations
  - Converges to closest local minimum
- → Spend more time on fancy solvers...

#### **Nonlinear Surface Deformation**

- Nonlinear Optimization
- Shell-Based Deformation
- (Differential Coordinates)

#### **Shell-Based Deformation**

- Discrete Shells
  [Grinspun et al, SCA 2003]
- Rigid Cells
   [Botsch et al, SGP 2006]
- As-Rigid-As-Possible Modeling [Sorkine & Alexa, SGP 2007]

#### **Discrete Shells**

- Main idea
  - Don't discretize continuous energy
  - Define discrete energy instead
  - Leads to simpler (still nonlinear) formulation
- Discrete energy
  - How to measure stretching on meshes?
  - How to measure bending on meshes?

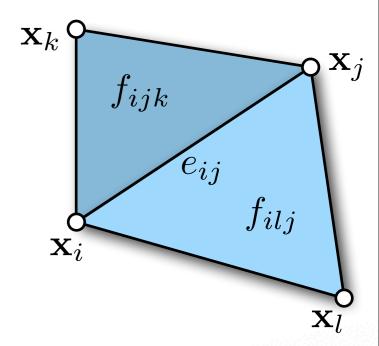

# Discrete Shell Energy

Stretching: Change of edge lengths

$$\sum_{e_{ij} \in E} \lambda_{ij} \left( |e_{ij}| - |\bar{e}_{ij}| \right)^2$$

Stretching: Change of triangle areas

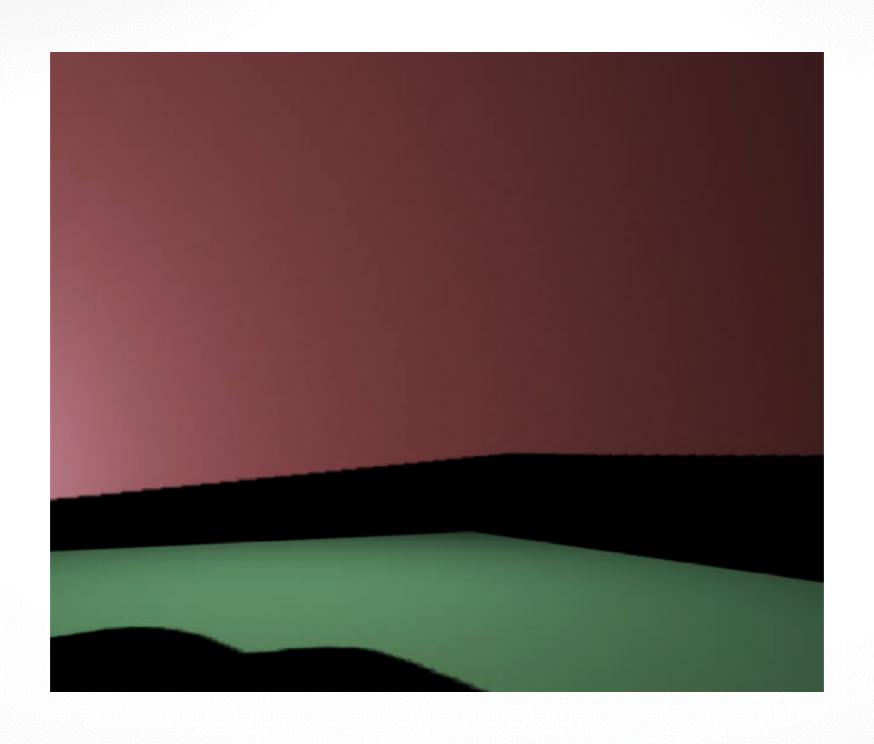

$$\sum_{f_{ijk} \in F} \lambda_{ijk} \left( |f_{ijk}| - |\bar{f}_{ijk}| \right)^2$$

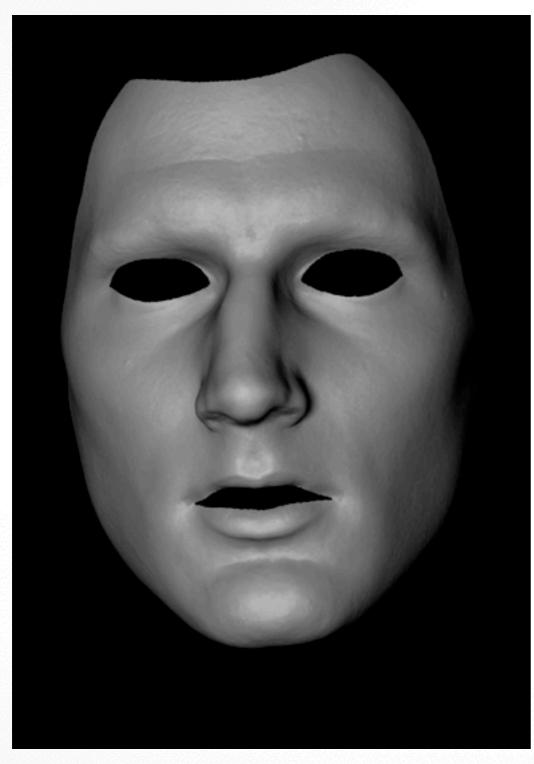

Bending: Change of dihedral angles

$$\sum_{e_{ij} \in E} \mu_{ij} \left( \theta_{ij} - \bar{\theta}_{ij} \right)^2$$

# Discrete Shell Energy

### **Realistic Facial Animation**

Linear model

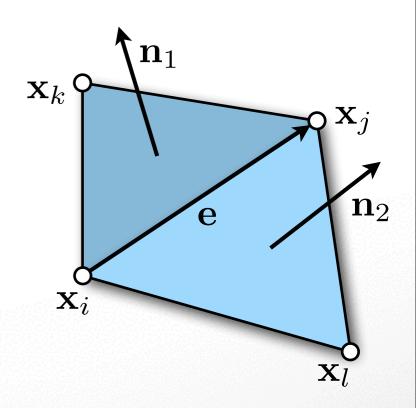

Nonlinear model

### **Discrete Energy Gradients**

Gradients of edge length

$$\begin{aligned} |e_{ij}| &= \|\mathbf{x}_j - \mathbf{x}_i\| \\ \frac{\partial |e_{ij}|}{\partial \mathbf{x}_i} &= \frac{-\mathbf{e}}{\|\mathbf{e}\|} \\ \frac{\partial |e_{ij}|}{\partial \mathbf{x}_j} &= \frac{\mathbf{e}}{\|\mathbf{e}\|} \end{aligned}$$

### **Discrete Energy Gradients**

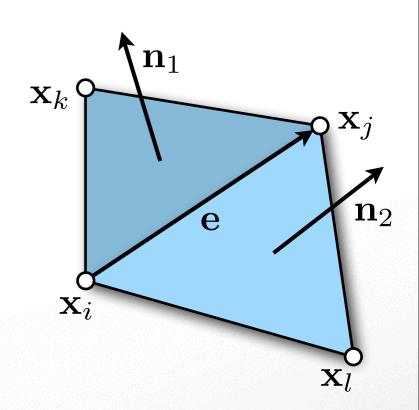

#### Gradients of triangle area

$$|f_{ijk}| = \frac{1}{2} \|\mathbf{n}_1\|$$

$$\frac{\partial |f_{ijk}|}{\partial \mathbf{x}_i} = \frac{\mathbf{n}_1 \times (\mathbf{x}_k - \mathbf{x}_j)}{2 \|\mathbf{n}_1\|}$$

$$\frac{\partial |f_{ijk}|}{\partial \mathbf{x}_j} = \frac{\mathbf{n}_1 \times (\mathbf{x}_i - \mathbf{x}_k)}{2 \|\mathbf{n}_1\|}$$

$$\frac{\partial |f_{ijk}|}{\partial \mathbf{x}_k} = \frac{\mathbf{n}_1 \times (\mathbf{x}_j - \mathbf{x}_i)}{2 \|\mathbf{n}_1\|}$$

### **Discrete Energy Gradients**

#### Gradients of dihedral angle

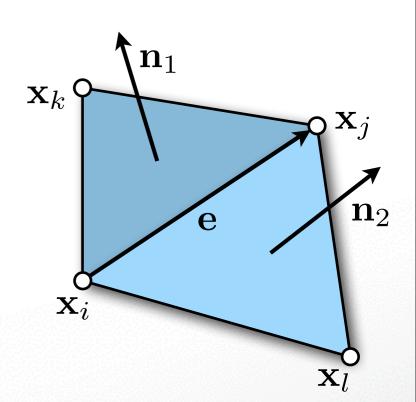

$$\theta = \operatorname{atan}\left(\frac{\sin \theta}{\cos \theta}\right) = \operatorname{atan}\left(\frac{(\mathbf{n}_{1} \times \mathbf{n}_{2})^{T} \mathbf{e}}{\mathbf{n}_{1}^{T} \mathbf{n}_{2} \cdot \|\mathbf{e}\|}\right)$$

$$\frac{\partial \theta}{\partial \mathbf{x}_{i}} = \frac{(\mathbf{x}_{k} - \mathbf{x}_{j})^{T} \mathbf{e}}{\|\mathbf{e}\|} \cdot \frac{-\mathbf{n}_{1}}{\|\mathbf{n}_{1}\|^{2}} + \frac{(\mathbf{x}_{l} - \mathbf{x}_{j})^{T} \mathbf{e}}{\|\mathbf{e}\|} \cdot \frac{-\mathbf{n}_{2}}{\|\mathbf{n}_{2}\|^{2}}$$

$$\frac{\partial \theta}{\partial \mathbf{x}_{j}} = \frac{(\mathbf{x}_{i} - \mathbf{x}_{k})^{T} \mathbf{e}}{\|\mathbf{e}\|} \cdot \frac{-\mathbf{n}_{1}}{\|\mathbf{n}_{1}\|^{2}} + \frac{(\mathbf{x}_{i} - \mathbf{x}_{l})^{T} \mathbf{e}}{\|\mathbf{e}\|} \cdot \frac{-\mathbf{n}_{2}}{\|\mathbf{n}_{2}\|^{2}}$$

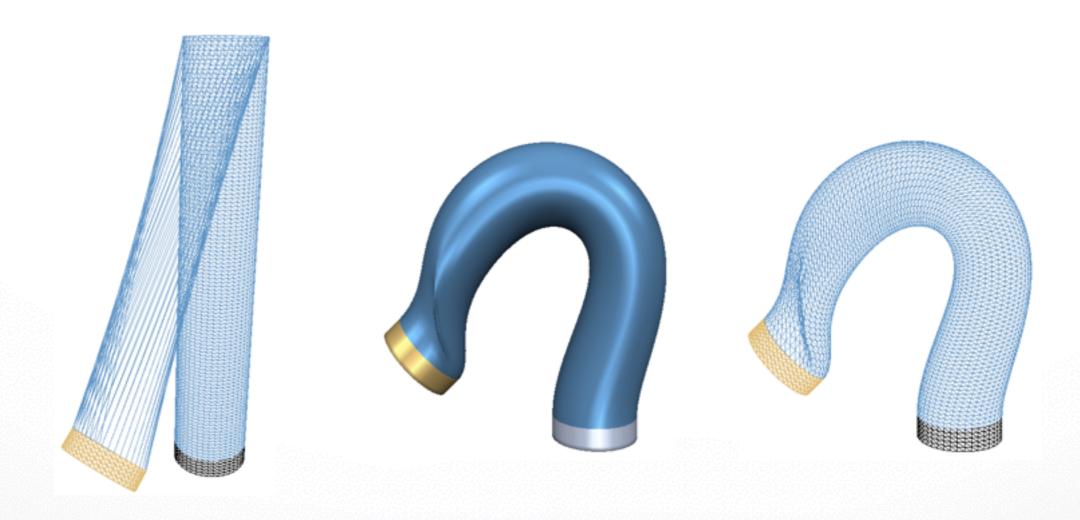

$$\frac{\partial \theta}{\partial \mathbf{x}_{l}} = \|\mathbf{e}\| \cdot \frac{-\mathbf{n}_{1}}{\|\mathbf{n}_{1}\|^{2}}$$

$$\frac{\partial \theta}{\partial \mathbf{x}_{l}} = \|\mathbf{e}\| \cdot \frac{-\mathbf{n}_{2}}{\|\mathbf{n}_{2}\|^{2}}$$

## Discrete Shell Editing

- Problems with large deformation
  - Bad initial state causes numerical problems

#### **Shell-Based Deformation**

- Discrete Shells
   [Grinspun et al, SCA 2003]
- Rigid Cells
   [Botsch et al, SGP 2006]
- As-Rigid-As-Possible Modeling [Sorkine & Alexa, SGP 2007]

# **Nonlinear Shape Deformation**

- Nonlinear editing too instable?
- Physically plausible vs. physically correct
- → Trade physical correctness for
  - Computational efficiency
  - Numerical robustness

# Elastically Connected Rigid Cells

- Qualitatively emulate thin-shell behavior
- Thin volumetric layer around center surface
- Extrude polygonal cell  $C_i$  per mesh face

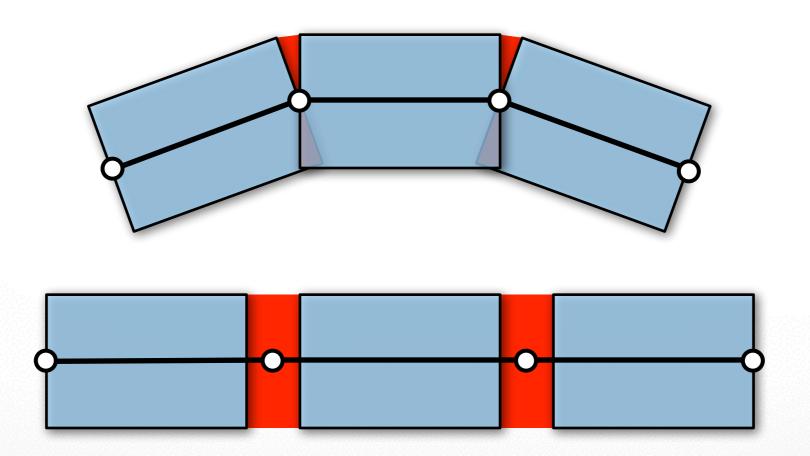

# Elastically Connected Rigid Cells

- Aim for robustness
  - Prevent cells from degenerating
  - → Keep cells *rigid*

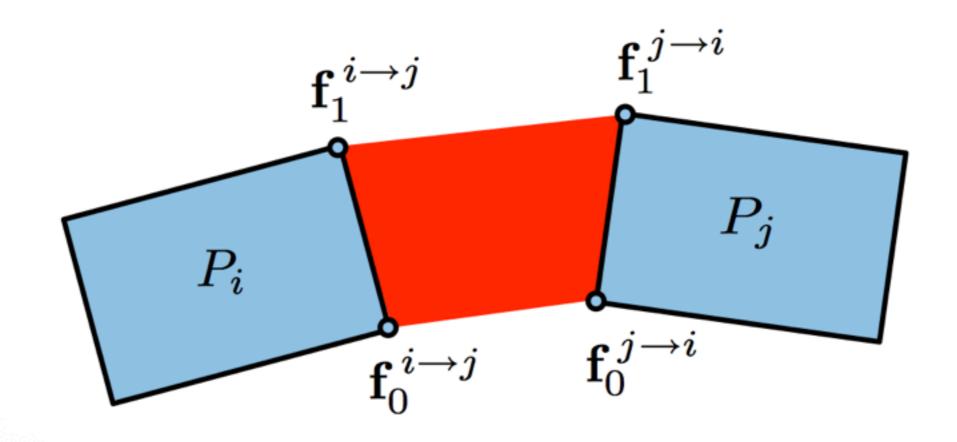

## **Elastically Connected Rigid Cells**

- Connect cells along their faces
  - Nonlinear elastic energy
  - Measures bending, stretching, twisting, ...

# **Notion of Prism Elements**

#### **Nonlinear Minimization**

• Find <u>rigid</u> motion  $T_i$  per cell  $C_i$ 

$$\min_{\{\mathbf{T}_i\}} \sum_{\{i,j\}} w_{ij} \int_{[0,1]^2} \left\| \mathbf{T}_i \left( \mathbf{f}^{i \to j} (\mathbf{u}) \right) - \mathbf{T}_j \left( \mathbf{f}^{j \to i} (\mathbf{u}) \right) \right\|^2 d\mathbf{u}$$

- Generalized global shape matching problem
  - Robust geometric optimization
  - Nonlinear Newton-type minimization
  - Hierarchical multi-grid solver

### **Newton-Type Iteration**

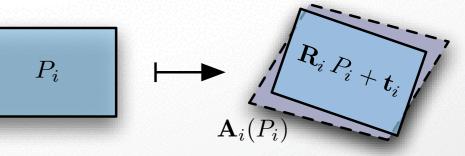

1. Linearization of rigid motions

$$\mathbf{R}_i \mathbf{x} + \mathbf{t}_i \approx \mathbf{x} + (\omega_i \times \mathbf{x}) + \mathbf{v}_i =: \mathbf{A}_i \mathbf{x}$$

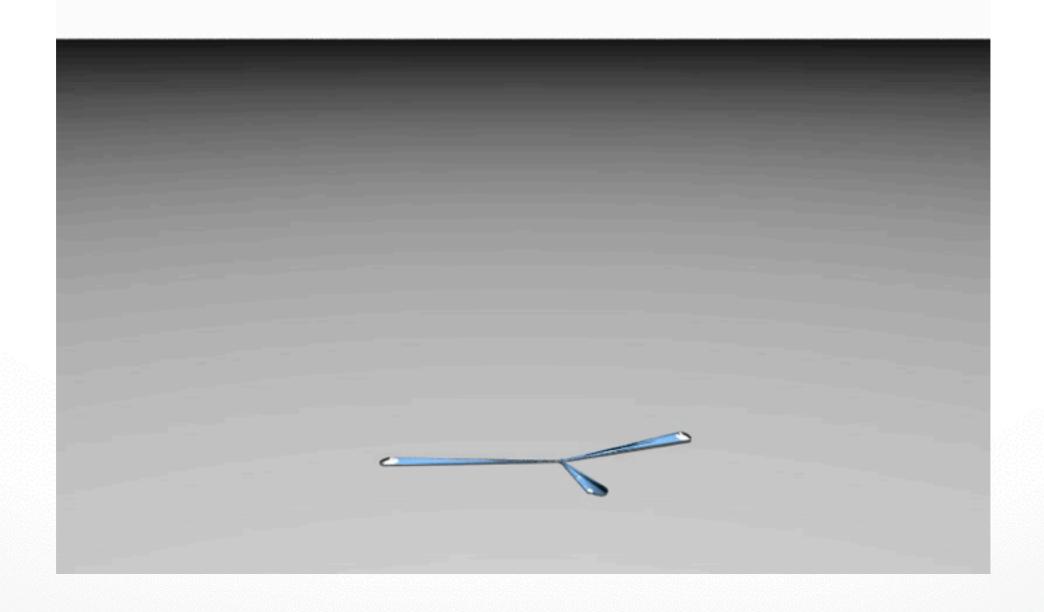

2. Quadratic optimization of velocities

$$\min_{\{\mathbf{v}_i, \, \omega_i\}} \sum_{\{i,j\}} w_{ij} \int_{[0,1]^2} \left\| \mathbf{A}_i \left( \mathbf{f}^{i \to j} (\mathbf{u}) \right) - \mathbf{A}_j \left( \mathbf{f}^{j \to i} (\mathbf{u}) \right) \right\|^2 d\mathbf{u}$$

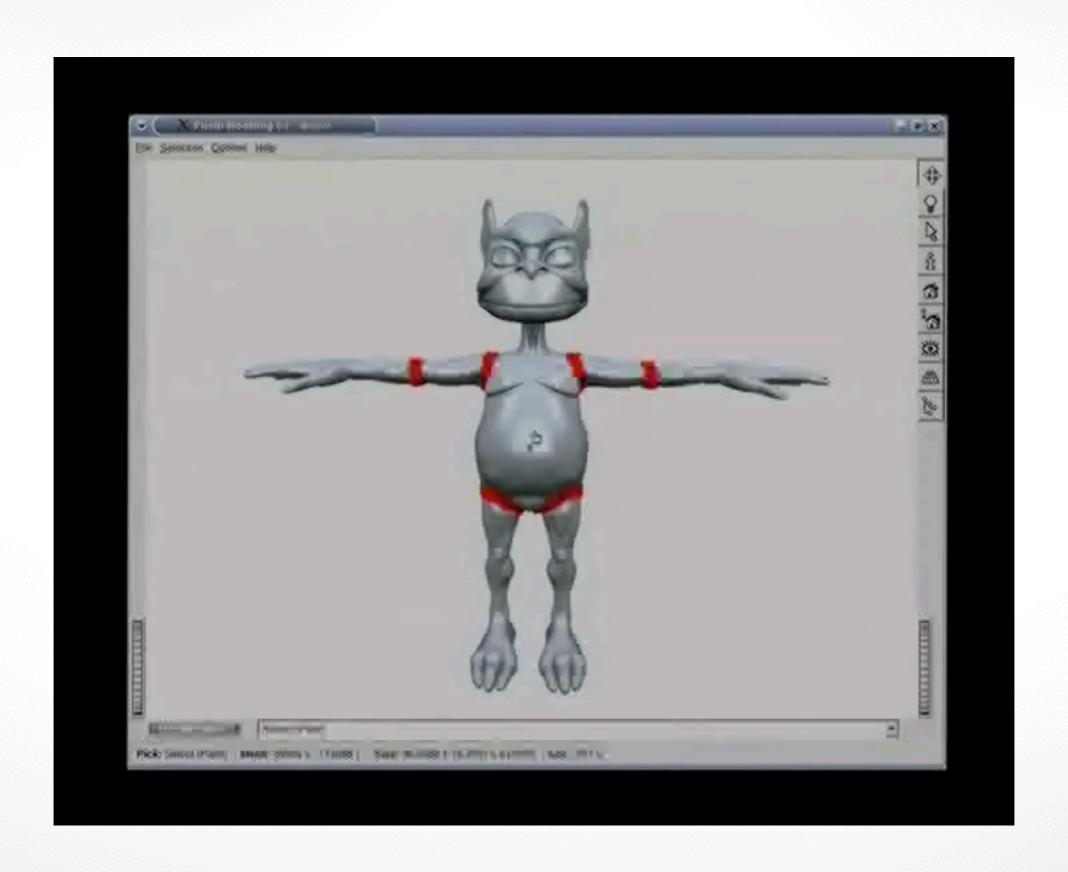

- 3. Project  $A_i$  onto rigid motion manifold
  - → Local shape matching

# Robustness

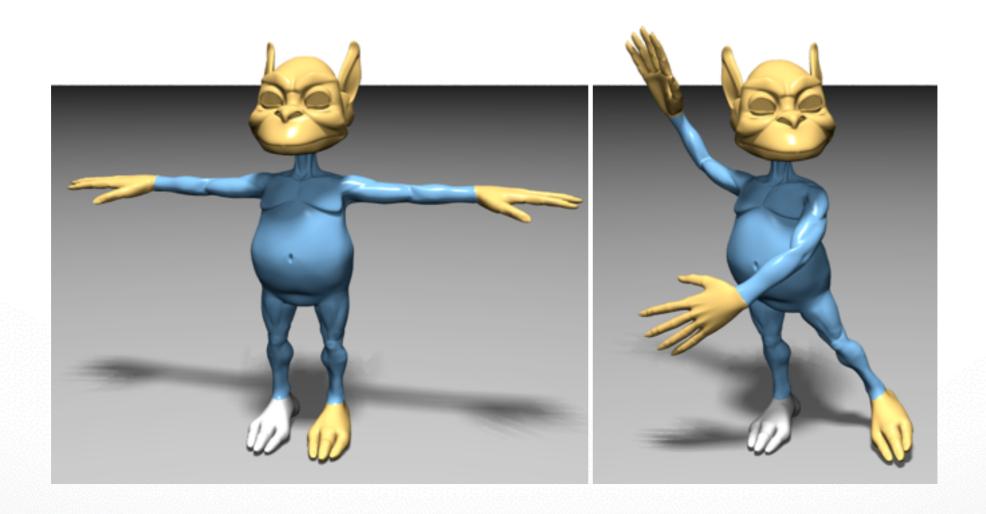

# **Character Posing**

### Goblin Posing

- Intuitive large scale deformations
- Whole session < 5 min</li>

#### **Shell-Based Deformation**

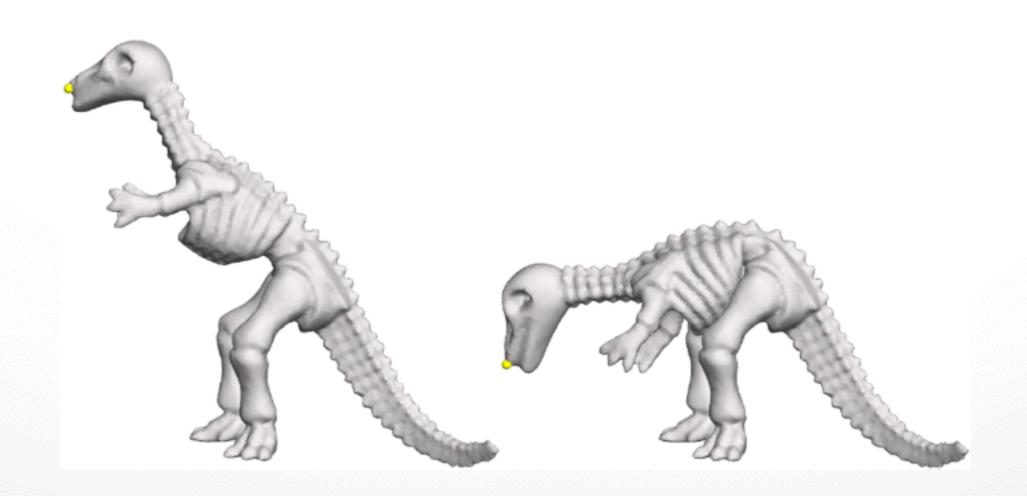

- Discrete Shells
   [Grinspun et al, SCA 2003]
- Rigid Cells
   [Botsch et al, SGP 2006]
- As-Rigid-As-Possible Modeling
   [Sorkine & Alexa, SGP 2007]

#### **Shell-Based Deformation**

- Discrete Shells
   [Grinspun et al, SCA 2003]
- Rigid Cells
   [Botsch et al, SGP 2006]
- As-Rigid-As-Possible Modeling
   [Sorkine & Alexa, SGP 2007]

#### **Surface Deformation**

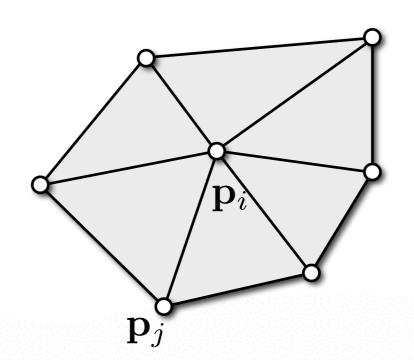

- Smooth large scale deformation
- Local as-rigid-as-possible behavior
  - Preserves small-scale details

## **Cell Deformation Energy**

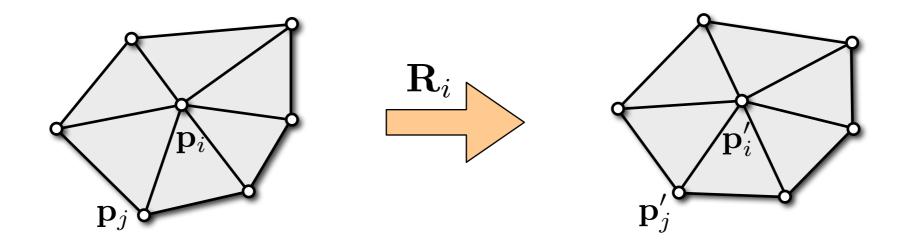

Vertex neighborhoods should deform rigidly

$$\sum_{j \in N(i)} \left\| \left( \mathbf{p}'_j - \mathbf{p}'_i \right) - \mathbf{R}_i \left( \mathbf{p}_j - \mathbf{p}_i \right) \right\|^2 \to \min$$

## **Cell Deformation Energy**

If p, p' are known then R<sub>i</sub> is uniquely defined

- Shape matching problem
  - Build covariance matrix  $S = PP'^T$
  - SVD:  $S = U\Sigma W^T$
  - Extract rotation  $\mathbf{R}_i = \mathbf{U}\mathbf{W}^T$

### **Total Deformation Energy**

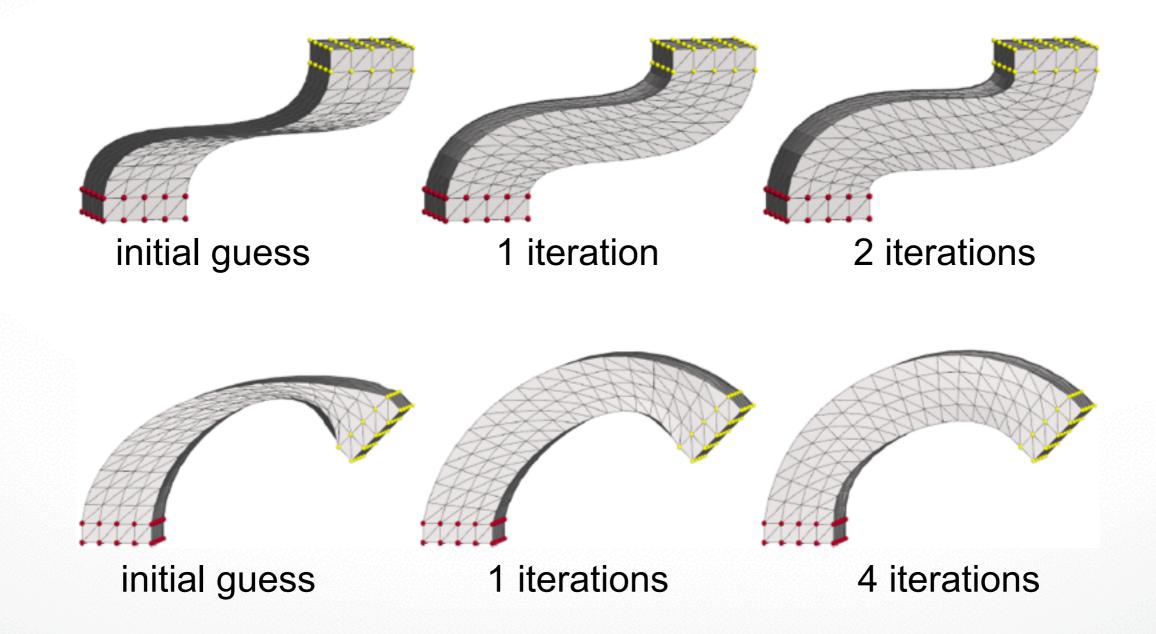

Sum over all vertex

$$\min_{\mathbf{p}'} \sum_{i=1}^{n} \sum_{j \in N(i)} \left\| \left( \mathbf{p}'_{j} - \mathbf{p}'_{i} \right) - \mathbf{R}_{i} \left( \mathbf{p}_{j} - \mathbf{p}_{i} \right) \right\|^{2}$$

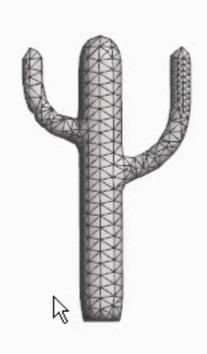

- Treat  $\mathbf{p}'$  and  $\mathbf{R}_i$  as separate variables
- Allows for alternating optimization
  - Fix  $\mathbf{p}'$ , find  $\mathbf{R}_i$ : Local shape matching per cell
  - Fix  $\mathbf{R}_i$ , find  $\mathbf{p}'$ : Solve Laplacian system

# As-Rigid-As-Possible Modeling

Start from naïve Laplacian editing as initial guess

# As-Rigid-As-Possilbe Modeling

#### **Shell-Based Deformation**

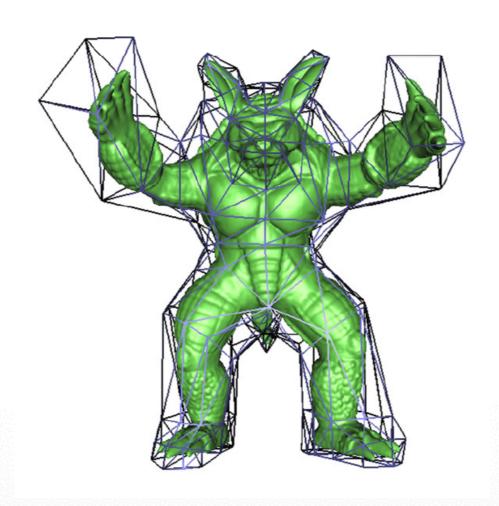

- Discrete Shells
   [Grinspun et al, SCA 2003]
- Rigid Cells
   [Botsch et al, SGP 2006]
- As-Rigid-As-Possible Modeling [Sorkine & Alexa, SGP 2007]

#### **Nonlinear Surface Deformation**

- Limitations of Linear Methods
- Shell-Based Deformation
- (Differential Coordinates)

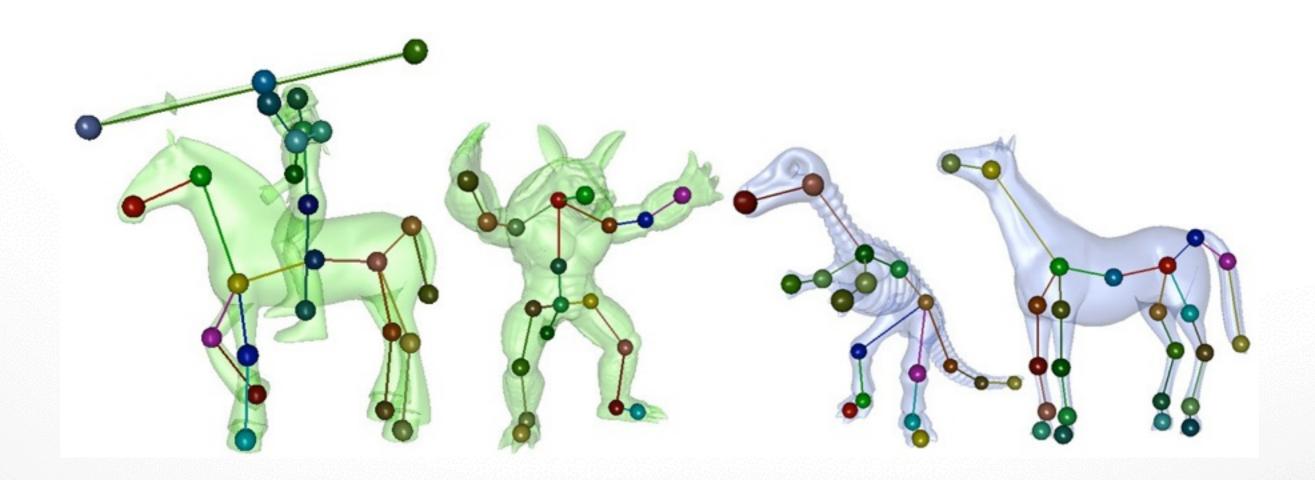

# **Subspace Gradient Deformation**

- Nonlinear Laplacian coordinates
- Least squares solution on coarse cage subspace

# Mesh Puppetry

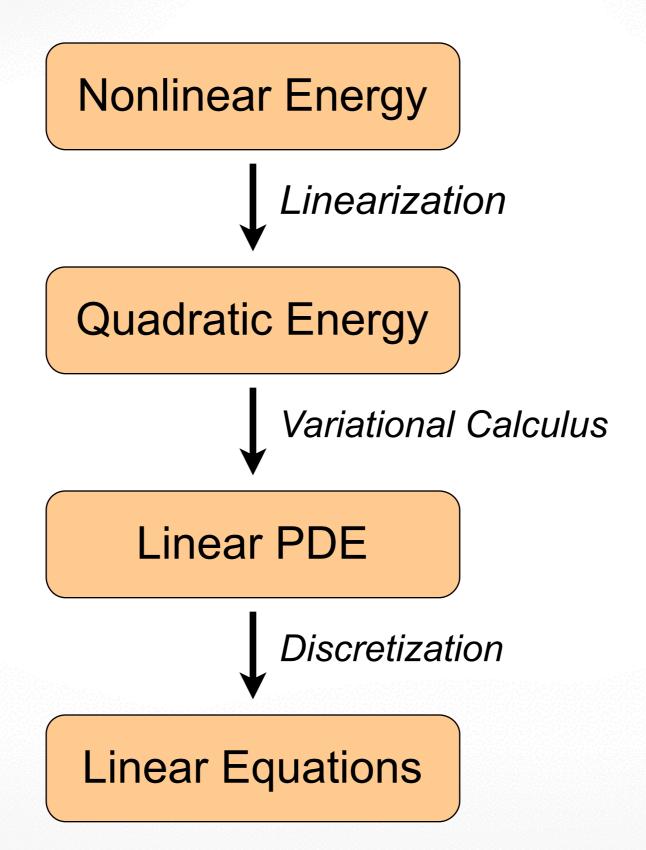

- Skeletons and Laplacian coordinates
- Cascading optimization

#### **Nonlinear Surface Deformation**

- Limitations of Linear Methods
- Shell-Based Deformation
- (Differential Coordinates)

#### **Linear Approaches**

### **Linear Approaches**

#### Resulting linear systems

– Shell-based 
$$\Delta^2 \mathbf{d} = \mathbf{0}$$

- Gradient-based 
$$\Delta \mathbf{p} = \nabla \cdot \mathbf{T}(\mathbf{g})$$

- Laplacian-based 
$$\Delta^2 \mathbf{p} = \Delta \mathbf{T}(\mathbf{l})$$

#### Properties

- Highly sparse
- Symmetric, positive definite (SPD)
- Solve for new RHS each frame!

#### **Linear SPD Solvers**

#### Dense Cholesky factorization

- Cubic complexity
- High memory consumption (doesn't exploit sparsity)

#### Iterative conjugate gradients

- Quadratic complexity
- Need sophisticated preconditioning

#### Multigrid solvers

- Linear complexity
- But rather complicated to develop (and to use)

#### Sparse Cholesky factorization

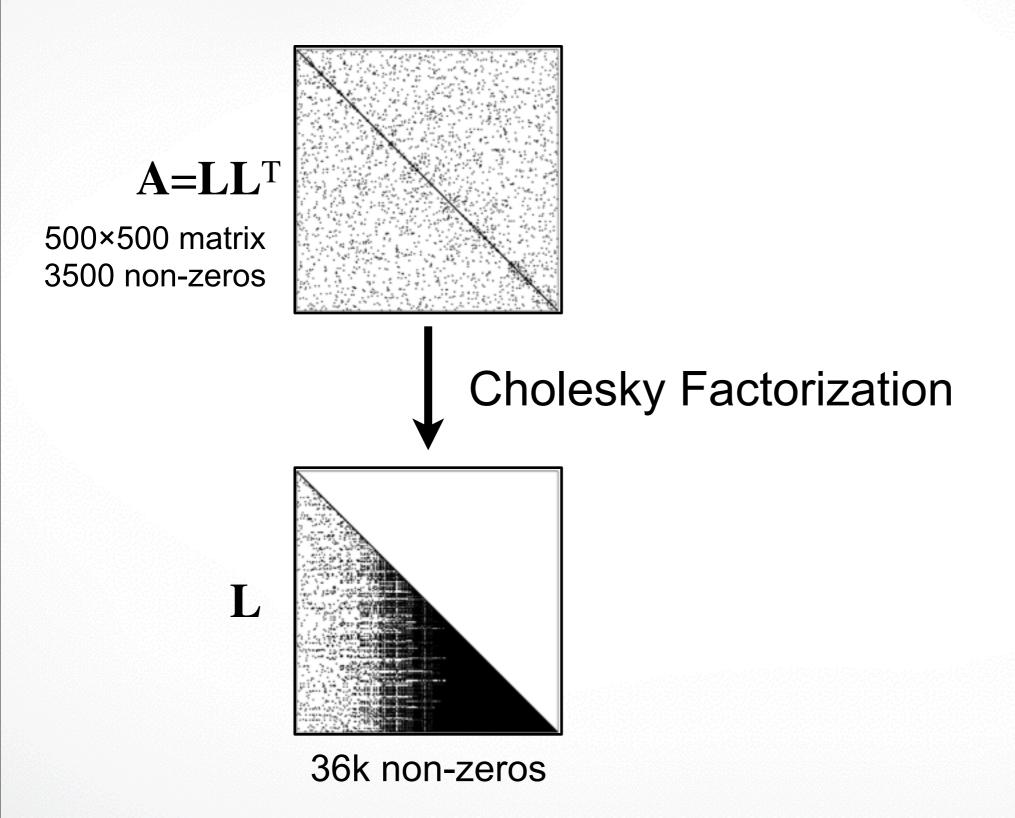

- Linear complexity
- Easy to use

# **Dense Cholesky Factorization**

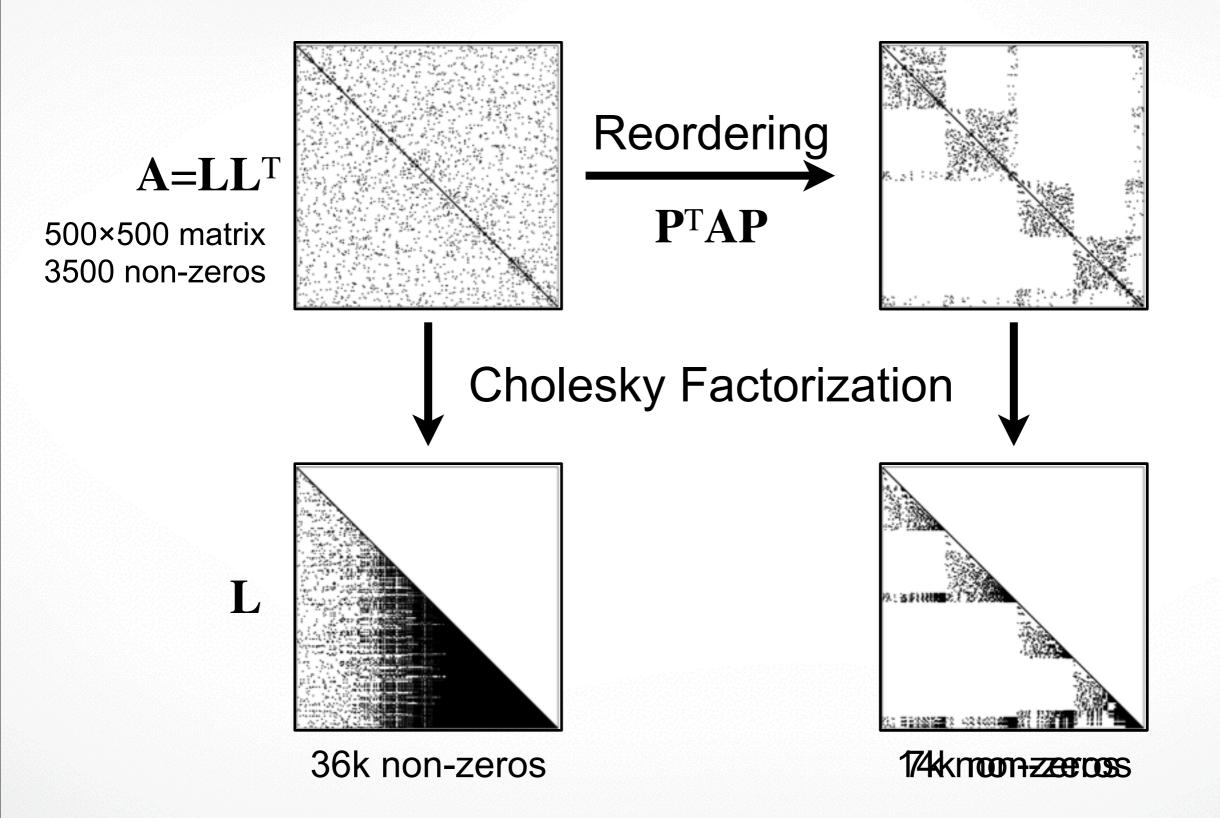

Solve 
$$Ax = b$$

- 1. Cholesky factorization  $A = LL^T$
- 2. Solve system  $y = L^{-1}b$ ,  $x = L^{-T}y$

### **Dense Cholesky Factorization**

# **Sparse Cholesky Factorization**

# **Sparse Cholesky Factorization**

Solve Ax = b

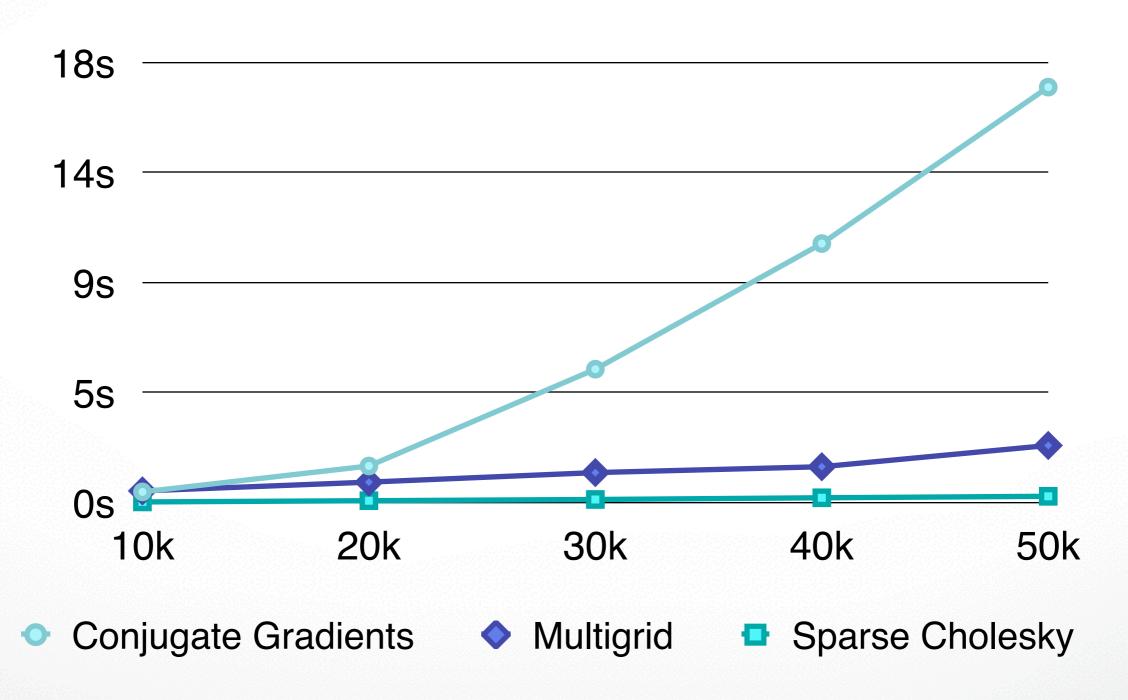

Pre-computation

- 1. Matrix re-ordering  $\tilde{\mathbf{A}} = \mathbf{P}^T \mathbf{A} \mathbf{P}$
- 2. Cholesky factorization  $\tilde{\mathbf{A}} = \mathbf{L}\mathbf{L}^T$
- 3. Solve system  $y = L^{-1}P^Tb$ ,  $x = PL^{-T}y$

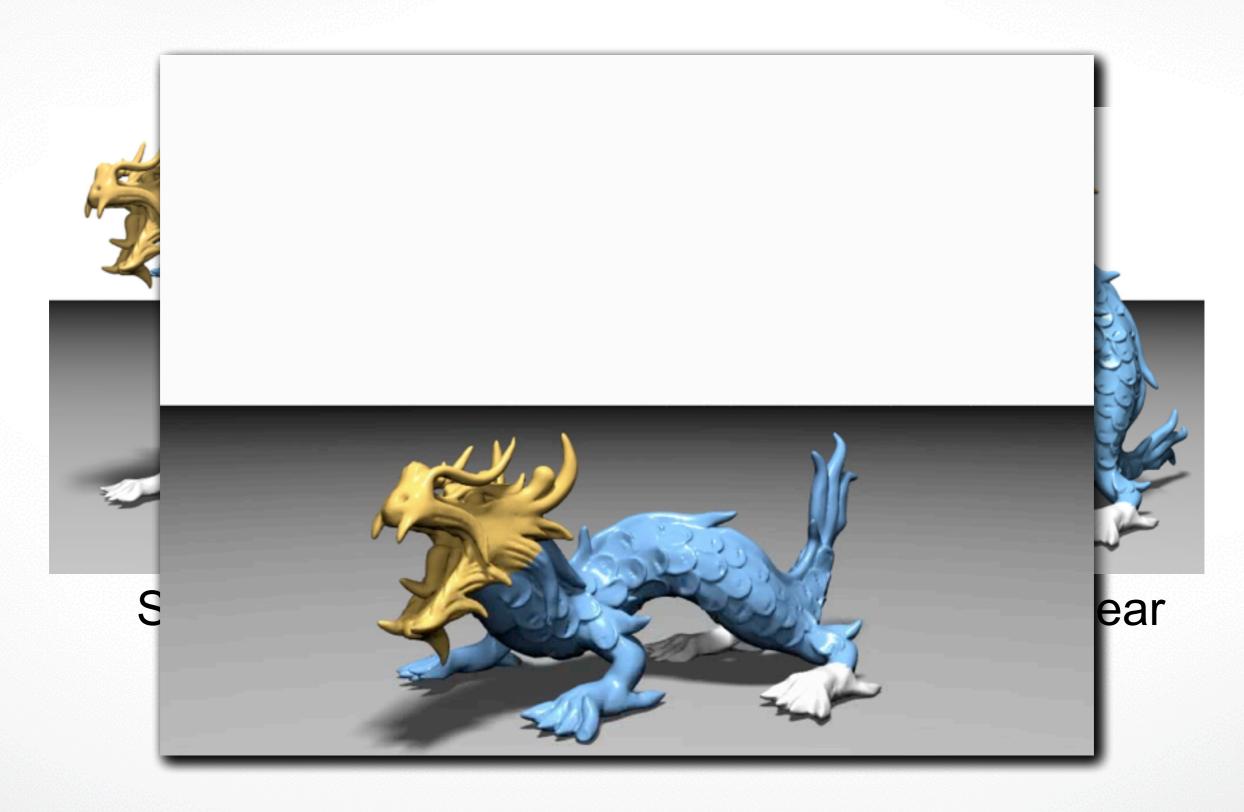

Per-frame computation

#### **Bi-Laplace System**

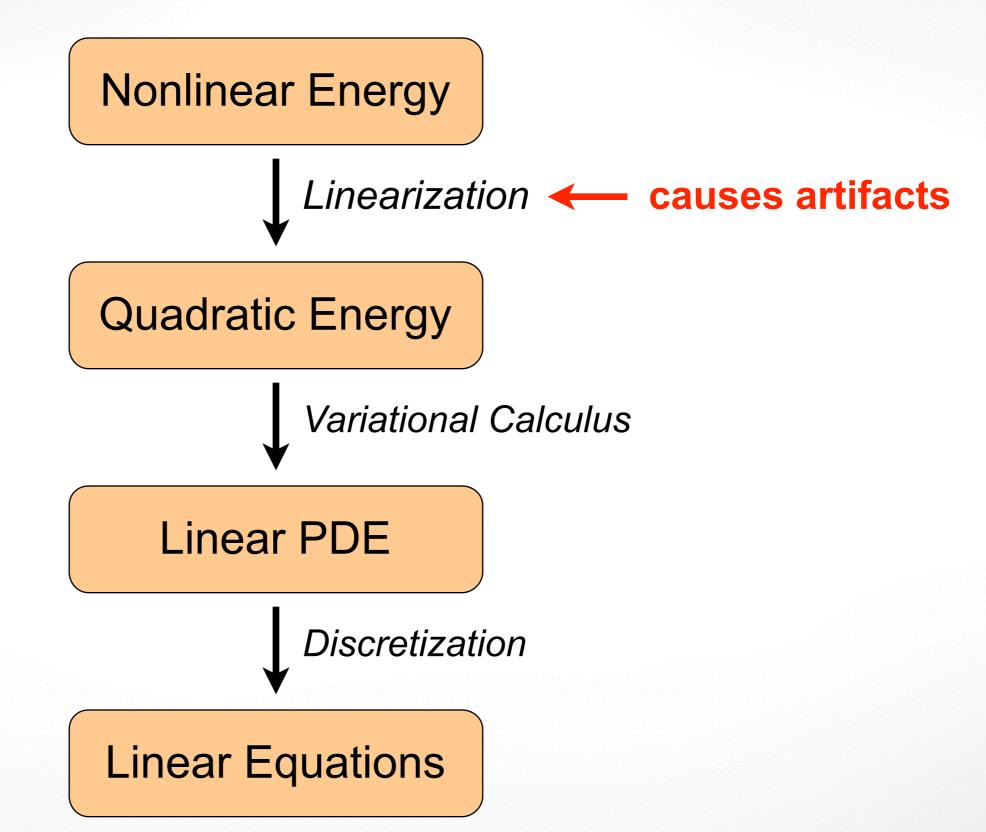

#### 3 Solutions (per frame costs)

# Linear vs. Non-Linear

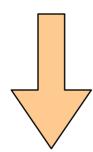

#### **Linear Approaches**

#### **Linearizations / Simplifications**

#### Shell-based deformation

$$\int_{\Omega} k_s \left\| \mathbf{I} - \mathbf{I}' \right\|^2 + k_b \left\| \mathbf{I} - \mathbf{I}' \right\|^2 du dv$$

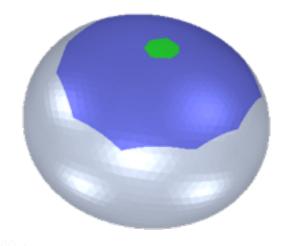

$$\int_{\Omega} k_s (\|\mathbf{d}_u\|^2 + \|\mathbf{d}_v\|^2) + k_b (\|\mathbf{d}_{uu}\|^2 + 2\|\mathbf{d}_{uv}\|^2 + \|\mathbf{d}_{vv}\|^2) dudv$$

# Linearizations / Simplifications

Gradient-based editing

$$\nabla \mathbf{T}(\mathbf{x}) = \mathbf{A}$$

### Linearizations / Simplifications

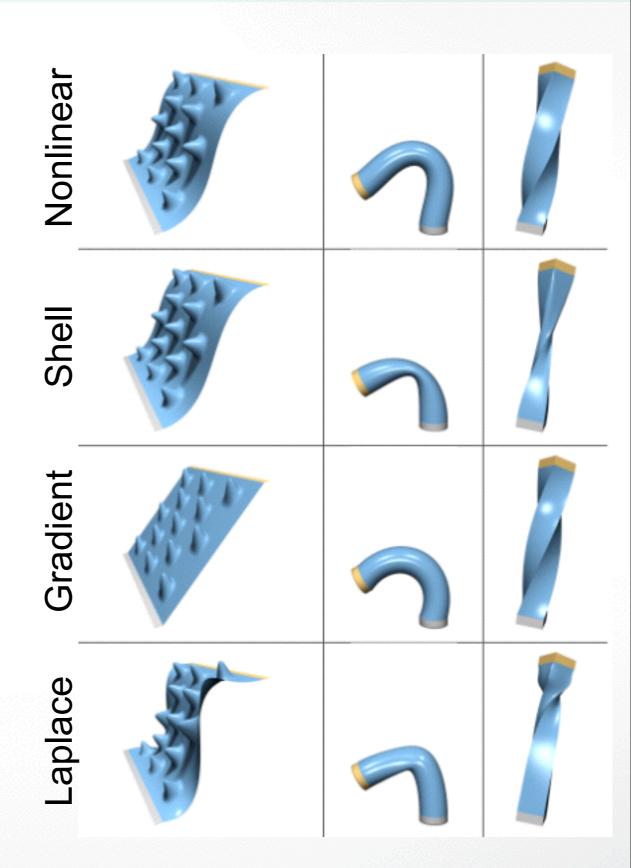

#### Laplacian surface editing

$$\mathbf{R}\mathbf{x} \approx \mathbf{x} + (\mathbf{r} \times \mathbf{x}) = \begin{pmatrix} 1 & -r_3 & r_2 \\ r_3 & 1 & -r_1 \\ -r_2 & r_1 & 1 \end{pmatrix} \mathbf{x}$$

$$\mathbf{T}_i = \begin{pmatrix} s & -r_3 & r_2 \\ r_3 & s & -r_1 \\ -r_2 & r_1 & s \end{pmatrix}$$

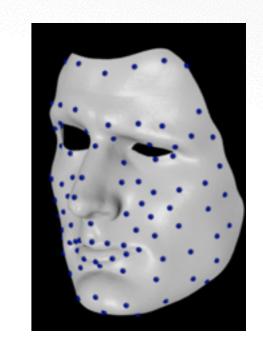

#### Linear vs. Non-Linear

- Analyze existing methods
  - Some work for translations
  - Some work for rotations
  - No method works for both

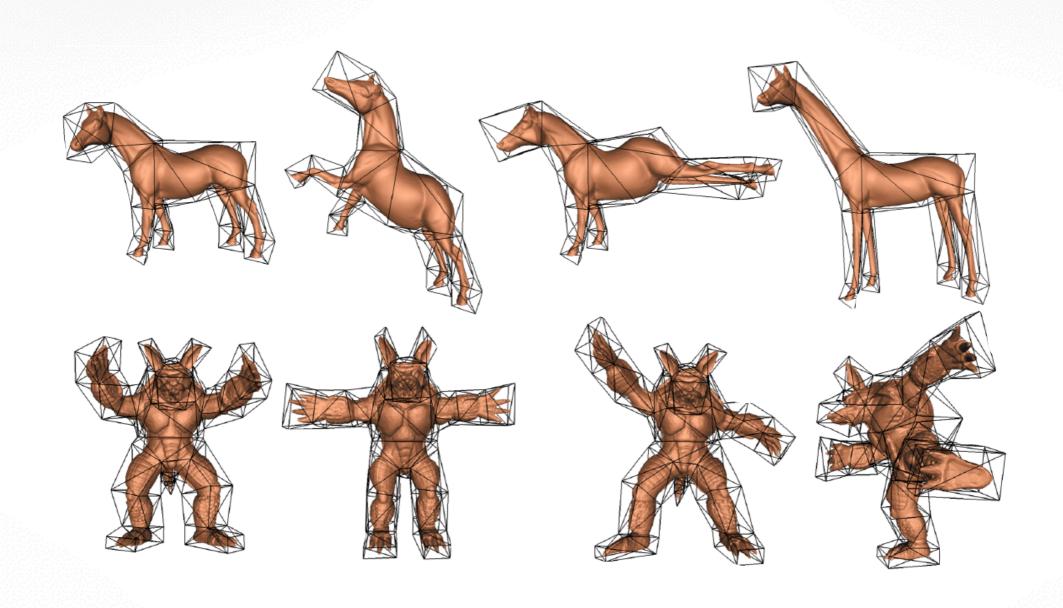

#### Linear vs. Non-Linear

- Linear approaches
  - Solve linear system each frame
  - Small deformations
  - Dense constraints
- Nonlinear approaches
  - Solve nonlinear problem each frame
  - Large deformations
  - Sparse constraints

### **Next Time**

# **Spatial Deformation**

# Projects

# **Geometry Processing Project**

#### Goal

- Small research project
- 1 week for project proposal, deadline March 21
  - choose between 3 options: A,B, or C
- 1 month for project, deadline April 21
- group, size up to 2
- contributes 30% to the final grade.
- send to peilun.hsieh@usc.edu

### Scope

#### A) For the disciplined

- Deformation Project, we will provide a framework
- You will implement a surface-based linear deformation algorithm (bending minimizing deformation).

#### B) For the creative [+10 points]

- Imagine an interesting topic around geometry processing or related to your PhD research or something you always wanted to do, and write a proposal.
- If it gets approved, you are good to go.

#### C) For the bad ass [+10 points]

- Implement a Siggraph, SGP, SCA, or Eurographics Paper.
- Geometry processing related of course ;-)

# **Project Submission**

#### **Deliverables for A)**

- Source Code, Binary, Data
- Text files describing the project, how to run it.

#### Deliverables for B) and C)

- Short Presentation will be held April 22 and 24th (length TBD)
- Video / Figures
- Documentation (pdf, doc, txt file): 2 or more pages, short paper style, be rigorous and organized, must include at least abstract, methodology, and results.

# **Project Proposal**

#### Structure

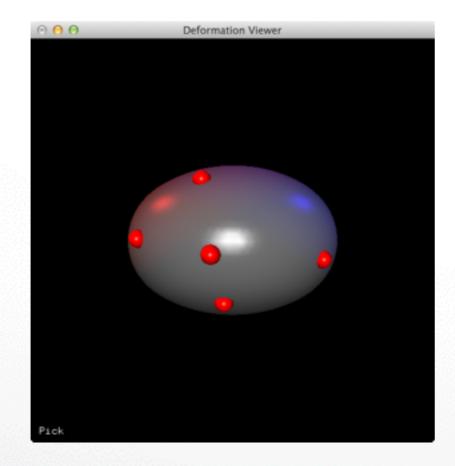

- Title
- Motivation
- Goal
- Proposed Method
- References

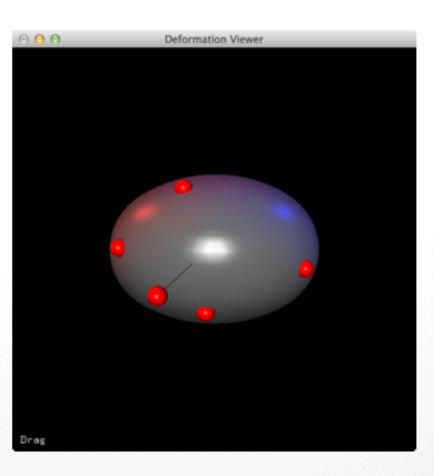

#### **Format**

- authors' names/student IDs
- 1-2 pages
- .doc, .pdf, .txt
- figures

# **Deformation Framework for A)**

- Inherit from MeshViewer with user interface:
  - 'p': pick a handle
  - 'd': drag a handle (last one with starting code)
  - 'm': move the mesh

# **Deformation Framework for A)**

add handle picking code to

```
DeformationViewer::mouse()
```

add deformation codes to

```
DeformationViewer::deform mesh()
```

- add extra classes and files if needed
- gmm is provided to solve linear systems

# Some ideas for B) or C)

- registration: articulated / deformable motions...
- **shape matching**: RANSAC, spin images, spherical harmonics...
- Smoothing: implicit surface fairing...
- parameterization: harmonic/conformal mapping...
- remeshing: anisotropic, quad mesh...
- deformation: As-rigid-as-possible, gradient-based...

• ...

http://cs599.hao-li.com

# Thanks!
