VEGA FEM LIBRARY

NEW: Vega FEM 2.0 released on Oct 8, 2013. New features described below.

Vega is a computationally efficient and stable C/C++ physics library for three-dimensional deformable object simulation. It is designed to model large deformations, including geometric and material nonlinearities, and can also efficiently simulate linear systems. Vega is open-source and free. It is released under the **3-clause BSD license**, which means that it can be used freely both in academic research and in commercial applications.

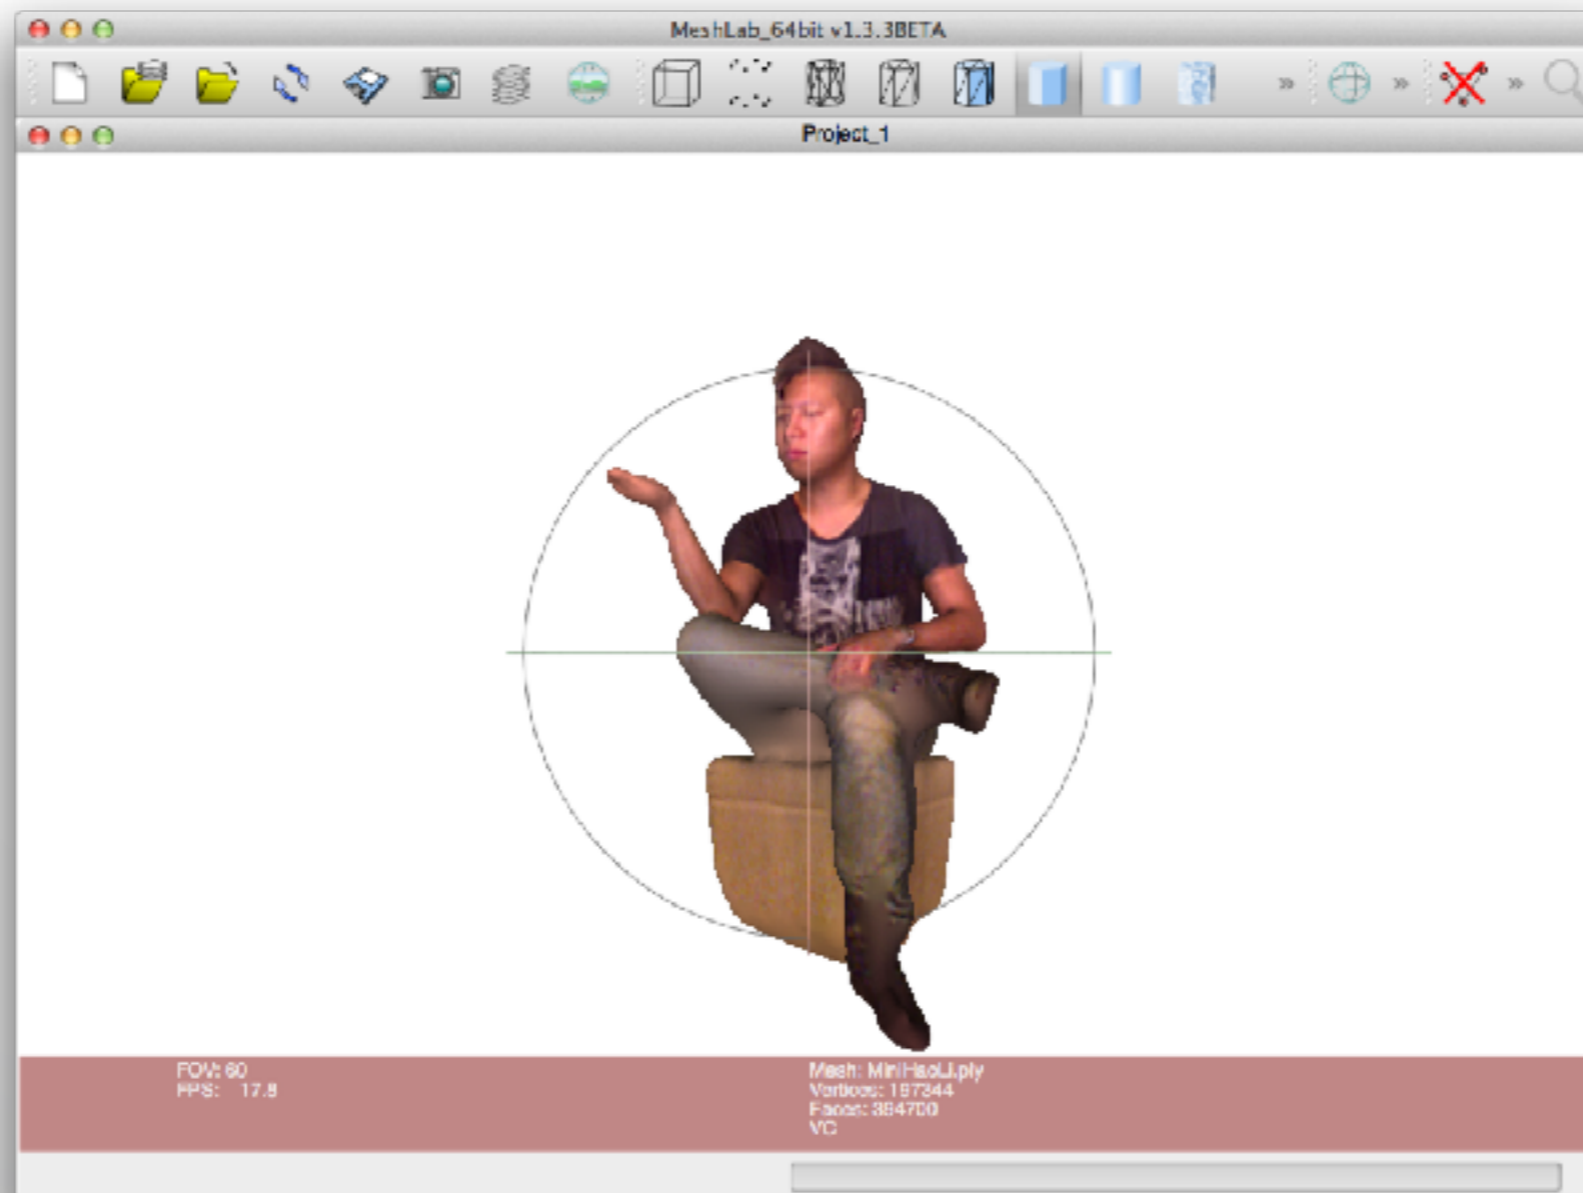

Vega implements several widely used methods for simulation of large deformations of 3D solid deformable objects:

- co-rotational linear FEM elasticity [MG04]; it can also compute the exact tangent stiffness matrix [Bar12] (similar to [CPSS10]),
- linear FEM elasticity [Sha90],
- invertible isotropic nonlinear FEM models [ITF04, TSIF05],

Mesh Processing Framework for Mac (www.bento3d.com)

Last Time

Discrete Representations

- Explicit (parametric, polygonal meshes)
- Implicit Surfaces (SDF, grid representation)
- Conversions
 - $E \rightarrow I$: Closest Point, SDF, Fast Marching
 - $I \rightarrow E$: Marching Cubes Algorithm

Geometry

Topology

Differential Geometry

Why do we care?

- Geometry of surfaces
- Mother tongue of physical theories
- Computation: processing / simulation

Motivation

We need differential geometry to compute

- surface curvature
- parameterization distortion
- deformation energies

Applications: 3D Reconstruction

Applications: Head Modeling

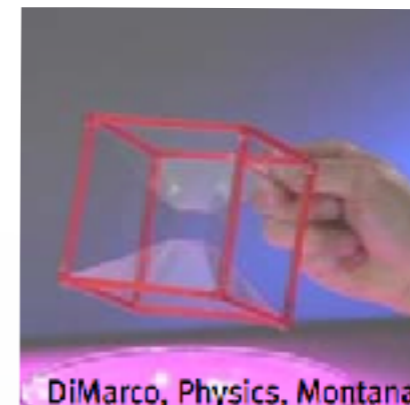

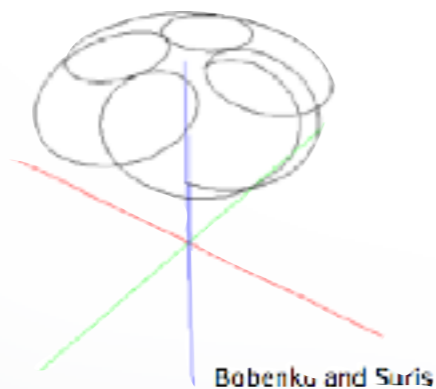

Applications: Facial Animation

Motivation

Geometry is the key

- studied for centuries (Cartan, Poincaré, Lie, Hodge, de Rham, Gauss, Noether...)
- mostly differential geometry
 - differential and integral calculus
- invariants and symmetries

Getting Started

How to apply DiffGeo ideas?

- surfaces as a collection of samples
 - and topology (connectivity)
- apply continuous ideas
 - BUT: setting is discrete
- what is the right way?
 - **discrete** vs. **discretized**

Let's look at that first

Getting Started

What characterizes structure(s)?

- What is shape?
 - Euclidean Invariance
- What is physics?
 - Conservation/Balance Laws
- What can we measure?
 - area, curvature, mass, flux, circulation

Getting Started

Invariant descriptors

- quantities invariant under a set of transformations

Intrinsic descriptor

- quantities which do not depend on a coordinate frame

Outline

- **Parametric Curves**
- Parametric Surfaces

Formalism & Intuition

Differential Geometry

Leonard Euler (1707-1783)

Carl Friedrich Gauss (1777-1855)

Parametric Curves

$$\mathbf{x} : [a, b] \subset \mathbb{R} \rightarrow \mathbb{R}^3$$

$$\mathbf{x}(t) = \begin{pmatrix} x(t) \\ y(t) \\ z(t) \end{pmatrix} \quad \mathbf{x}_t(t) := \frac{d\mathbf{x}(t)}{dt} = \begin{pmatrix} dx(t)/dt \\ dy(t)/dt \\ dz(t)/dt \end{pmatrix}$$

Recall: Mappings

Injective

NO SELF-INTERSECTIONS

Surjective

SELF-INTERSECTIONS
AMBIGUOUS PARAMETERIZATION

Bijjective

Parametric Curves

A parametric curve $\mathbf{x}(t)$ is

- simple: $\mathbf{x}(t)$ is injective (no self-intersections)
- differentiable: $\mathbf{x}_t(t)$ is defined for all $t \in [a, b]$
- regular: $\mathbf{x}_t(t) \neq \mathbf{0}$ for all $t \in [a, b]$

Length of a Curve

Let $t_i = a + i\Delta t$ and $\mathbf{x}_i = \mathbf{x}(t_i)$

Length of a Curve

Polyline chord length

$$S = \sum_i \|\Delta \mathbf{x}_i\| = \sum_i \left\| \frac{\Delta \mathbf{x}_i}{\Delta t} \right\| \Delta t, \quad \Delta \mathbf{x}_i := \|\mathbf{x}_{i+1} - \mathbf{x}_i\|$$

norm change

Curve arc length ($\Delta t \rightarrow 0$)

$$s = s(t) = \int_a^t \|\mathbf{x}_t\| dt$$

length =
integration of infinitesimal change
× norm of speed

Re-Parameterization

Mapping of parameter domain

$$u : [a, b] \rightarrow [c, d]$$

Re-parameterization w.r.t. $u(t)$

$$[c, d] \rightarrow \mathbb{R}^3, \quad t \mapsto \mathbf{x}(u(t))$$

Derivative (chain rule)

$$\frac{d\mathbf{x}(u(t))}{dt} = \frac{d\mathbf{x}}{du} \frac{du}{dt} = \mathbf{x}_u(u(t)) u_t(t)$$

Re-Parameterization

Example

$$\mathbf{f} : \left[0, \frac{1}{2}\right] \rightarrow \mathbb{R}^2, \quad t \mapsto (4t, 2t)$$

$$\phi : \left[0, \frac{1}{2}\right] \rightarrow [0, 1], \quad t \mapsto 2t$$

$$\mathbf{g} : [0, 1] \rightarrow \mathbb{R}^2, \quad t \mapsto (2t, t)$$

$$\Rightarrow \mathbf{g}(\phi(t)) = \mathbf{f}(t)$$

Arc Length Parameterization

Mapping of parameter domain:

$$t \mapsto s(t) = \int_a^t \|\mathbf{x}_t\| dt$$

Parameter s for $\mathbf{x}(s)$ equals length from $\mathbf{x}(a)$ to $\mathbf{x}(s)$

$$\mathbf{x}(s) = \mathbf{x}(s(t)) \quad ds = \|\mathbf{x}_t\| dt$$

same infinitesimal change

Special properties of resulting curve

$$\|\mathbf{x}_s(s)\| = 1, \quad \mathbf{x}_s(s) \cdot \mathbf{x}_{ss}(s) = 0$$

defines orthonormal frame

The Frenet Frame

Taylor expansion

$$\mathbf{x}(t+h) = \mathbf{x}(t) + \mathbf{x}_t(t)h + \frac{1}{2}\mathbf{x}_{tt}(t)h^2 + \frac{1}{6}\mathbf{x}_{ttt}(t)h^3 + \dots$$

for convergence analysis and approximations

Define local frame $(\mathbf{t}, \mathbf{n}, \mathbf{b})$ (Frenet frame)

$$\mathbf{t} = \frac{\mathbf{x}_t}{\|\mathbf{x}_t\|} \quad \mathbf{n} = \mathbf{b} \times \mathbf{t} \quad \mathbf{b} = \frac{\mathbf{x}_t \times \mathbf{x}_{tt}}{\|\mathbf{x}_t \times \mathbf{x}_{tt}\|}$$

tangent

main normal

binormal

The Frenet Frame

Orthonormalization of local frame

local affine frame

Frenet frame

The Frenet Frame

Frenet-Serret: Derivatives w.r.t. arc length s

$$\begin{aligned}\mathbf{t}_s &= && +\kappa\mathbf{n} \\ \mathbf{n}_s &= & -\kappa\mathbf{t} && +\tau\mathbf{b} \\ \mathbf{b}_s &= && -\tau\mathbf{n}\end{aligned}$$

Curvature (deviation from straight line)

$$\kappa = \|\mathbf{x}_{ss}\|$$

Torsion (deviation from planarity)

$$\tau = \frac{1}{\kappa^2} \det([\mathbf{x}_s, \mathbf{x}_{ss}, \mathbf{x}_{sss}])$$

Curvature and Torsion

Planes defined by \mathbf{x} and two vectors:

- osculating plane: vectors \mathbf{t} and \mathbf{n}
- normal plane: vectors \mathbf{n} and \mathbf{b}
- rectifying plane: vectors \mathbf{t} and \mathbf{b}

Osculating circle

- second order contact with curve
- center $\mathbf{c} = \mathbf{x} + (1/\kappa)\mathbf{n}$
- radius $1/\kappa$

Curvature and Torsion

- **Curvature**: Deviation from straight line
- **Torsion**: Deviation from planarity
- Independent of parameterization
 - **intrinsic** properties of the curve
- Euclidean invariants
 - **invariant** under rigid motion
- Define curve **uniquely** up to a rigid motion

Curvature: Some Intuition

A line through two points on the curve (Secant)

Curvature: Some Intuition

A line through two points on the curve (Secant)

Curvature: Some Intuition

Tangent, the first approximation

limiting secant as the two points come together

Curvature: Some Intuition

Circle of curvature

Consider the circle passing through 3 points of the curve

Curvature: Some Intuition

Circle of curvature

The limiting circle as three points come together

Curvature: Some Intuition

Radius of curvature r

Curvature: Some Intuition

Radius of curvature r

$$\kappa = \frac{1}{r}$$

Curvature

Curvature: Some Intuition

Signed curvature

Sense of traversal along curve

Curvature: Some Intuition

Gauß map $\hat{n}(\mathbf{x})$

Point on curve maps to point on unit circle

Curvature: Some Intuition

Shape operator (Weingarten map)

Change in normal as we slide along curve

negative directional derivative D of Gauß map

$$\mathbf{S}(\mathbf{v}) = -D_{\mathbf{v}}\hat{\mathbf{n}}$$

describes directional curvature

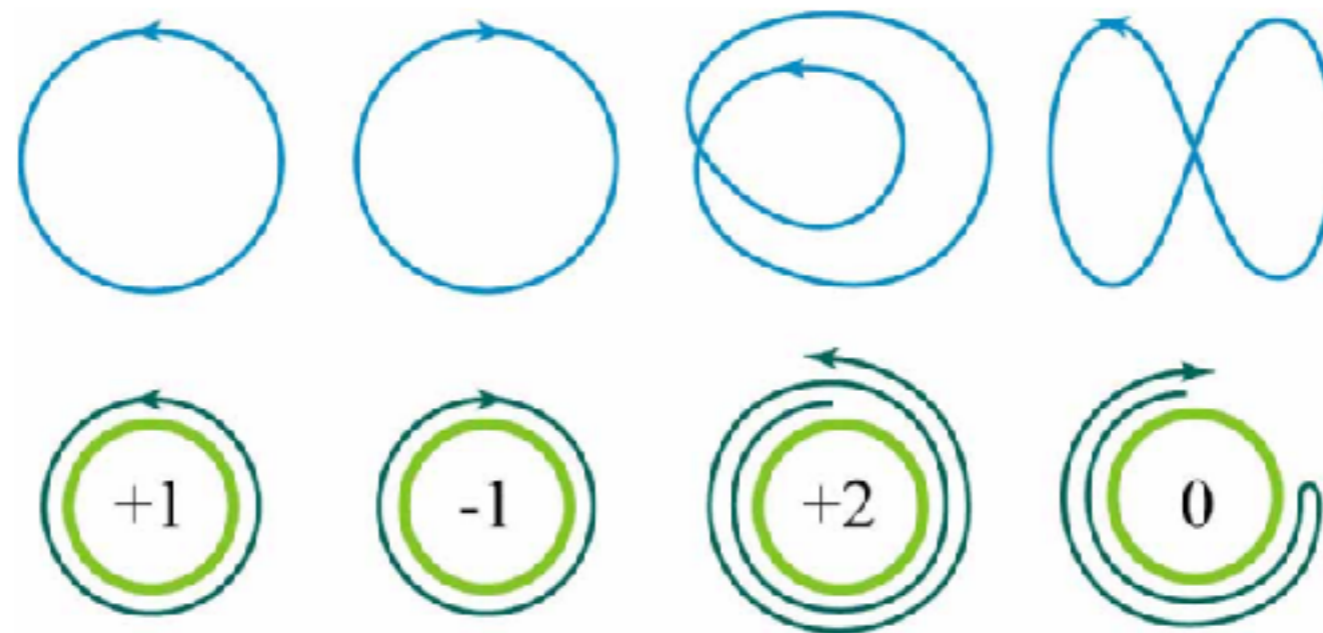

using normals as degrees of freedom

→ accuracy/convergence/implementation (discretization)

Curvature: Some Intuition

Turning number, k

Number of orbits in Gaussian image

Curvature: Some Intuition

Turning number theorem

For a closed curve, the integral of curvature is an integer multiple of 2π

$$\int_{\Omega} \kappa ds = 2\pi k$$

Take Home Message

In the limit of a refinement sequence, discrete measure of length and curvature **agree** with continuous measures
